

Active Network Management

SECURE, MANAGED DELIVERY OF DATA

- Future proof
- Lone Worker support
- Fully audited and managed data delivery
- Secure data cannot be intercepted and read
- We partner with you, now and the future

“Ultimately, Cognito’s managed solution, flexible application tool and Network failover capability stood head and shoulders over any other mobile solution offering”

Patrick Gallagher, Director Of London Servicecentres, Citysprint

MANAGED NETWORK

In order to build a resilient, flexible and secure Mobile Workforce Management solution, you need a robust end to end network. Building this network yourself contains hidden costs, for example you will have to coordinate different suppliers such as mobile and fixed line operators and new capital equipment and software will be required to build the supporting network infrastructure.

Cognito® manages those worries for you. As a solutions provider with nearly 20 years experience and over 150 successful deployments, we are used to solving the challenges involved in building the mixed communications infrastructure required to deliver world-class connectivity and communications. We can select the best combination of fixed and mobile communications, including WiFi to connect your offices, depots and mobile workforce with a reliable and cost effective managed communications infrastructure.

Partnering with Cognito gives you connectivity that’s non-invasive to your existing network. By allowing us to deliver and manage your communications needs, you get new functionality with a minimal investment in hardware or training, allowing you to rapidly deliver benefits to the business with your existing IT resources.

REAL-TIME DATA

Cognito’s end-to-end managed communication solutions, coupled with software timers in its client applications enable robust Lone Worker solutions. Knowing, not hoping, that when packets are sent that they are received is a key factor in making central decisions about whether to mobilise support to isolated workers, fulfilling Health and Safety obligations.

SECURITY

Security is embedded into the Cognito Mobile Workforce Management solution.

“Cognito demonstrated a high level of understanding of the complexities involved in providing a resilient Mobile Workforce Management solution. It was clear that they had knowledge, experience and the technology that matched what we were looking for”

Mike Tomlinson, Project Manager, PME

- Integrated security including user validation and password authentication to secure the physical device
- Automated, hidden security, including SIM card and Hardware ID pairing, solution logon and rolling encrypted password authentication, secures all data transactions
- Packet encryption to protect data in motion across public networks

OPTIMISED COMMUNICATION MANAGEMENT

Cognito’s resilient and audited communications architecture offers:

- Positive acknowledgement of all data transmissions at each stage of transfer providing real-time visibility of transaction status and complete history
- Guaranteed data delivery stores data until the device, network or back office system is available, ensuring that data is delivered regardless of coverage or system issues
- Managed connection provides a secure environment or “closed user” group with maximum resilience
- Built in client software timers supporting Lone Worker applications
- Internet access through the corporate firewall, offering access control and session, volume and time limits to fulfil company obligations regarding business-only use
- Configurable store of large data files such as photographs for later upload via a cradle or WiFi connection to minimise GPRS data costs.
